

LIVE STAGE — Official Trading Rules

Once a trader successfully completes the evaluation process (Step 1 or Step 2), the account progresses to the **Live Stage**.

At this stage, traders operate under real trading conditions while continuing to follow responsible risk management and program guidelines.

The Live Stage is designed to provide traders with **flexibility, transparency and a sustainable trading environment** where disciplined traders can operate and request payouts.

The objective is simple:

allow profitable traders to operate consistently while maintaining responsible risk management.

1. Risk Management

To keep the account active, the following risk limits must always be respected.

These limits help maintain a stable trading environment while still allowing traders flexibility in their strategies.

Max Daily Loss Limit

The Live account is subject to a **Max Daily Loss Limit**.

- **3% for 1-Step accounts**
- **5% for 2-Step accounts**

At the start of each trading day, the system records the **higher value between the account balance or account equity**.

The allowed daily loss is calculated as the defined percentage of that value.

All calculations are based on **equity**, meaning both closed trades and floating profit or loss from open positions are included.

Example

Account balance: **\$100,000**

Daily loss limit:

- **1-Step account** → **\$3,000**
- **2-Step account** → **\$5,000**

This means the account equity must not reach or fall below the following levels during the trading day:

- 1-Step Account → \$97,000
- 2-Step Account → \$95,000

The Maximum Daily Loss is calculated based on equity, which includes both closed and floating positions.

If the account equity reaches or falls below these levels at any time during the trading day, the Maximum Daily Loss rule will be considered breached, and the account will no longer continue in the program.

Daily Reset

The Daily Loss Limit resets automatically when the trading server resets at the end of the trading day.

The reset occurs at the daily market rollover (New York close / server reset).

This corresponds approximately to:

- 21:00 UTC
- 22:00 CET (Central European Time)
- 01:00 GST (Gulf Standard Time – UAE)
- 02:30 IST (India Standard Time)

Each new trading day begins at this moment with a fresh daily loss limit.

Max Loss Limit (Fixed)

In addition to the daily loss limit, the account also follows a **Max Loss Limit**.

- **6% for 1-Step accounts**
- **10% for 2-Step accounts**

This rule defines the maximum drawdown allowed during the Live Stage.

The maximum loss is calculated from the **initial account balance**.

Example

Initial account: **\$100,000**

Maximum loss allowed:

- **1-Step account → \$6,000**
- **2-Step account → \$10,000**

If the account equity reaches or falls below this level, the account will be **permanently closed**.

This limit remains **fixed** and does not move even if the account balance increases.

2. Risk Management

The Live Stage requires traders to maintain **professional and sustainable trading behavior**.

The goal is to ensure that trading activity reflects **real market trading practices**, not excessive risk-taking.

Max Risk Per Trade Idea

The maximum risk allowed per trade idea is **3% of the account balance**.

Risk refers to the **maximum potential loss of a trade**, usually defined by the stop-loss level.

If a stop-loss is not used, the risk may be evaluated based on:

- position size
 - leverage
 - potential market exposure
-

What is considered a Trade Idea?

A **trade idea** refers to a group of trades that are essentially part of the same position.

A trade idea is defined as:

- the same instrument
- the same trading direction
- trades opened within a short time window

Example

Opening several **BUY trades on EURUSD within a few minutes** is considered **one trade idea**.

Splitting a position into multiple smaller trades to bypass the risk limit is **not allowed**.

To ensure trades are considered separate ideas, there must be **at least 5 minutes between entries** in the same direction on the same instrument.

This does not restrict scalping or short-term trading. Traders may still open multiple trades quickly, but those trades will be considered part of the same trade idea for risk calculation purposes.

Maximum Exposure per Instrument

To avoid excessive concentration of risk, the total exposure per instrument must **not exceed 4% of the account balance**.

Example

Account balance: **\$100,000**

Maximum exposure per instrument: **\$4,000**

Opening multiple trades that together exceed this exposure may be considered a **risk rule violation**.

If this happens, the risk team may:

- request reduction of exposure
 - temporarily restrict trading on that instrument
 - suspend the account if violations continue
-

Maximum Capital Allocation

The maximum total capital allocation per trader within the program is **\$400,000**.

This limit applies to the **combined capital across all accounts owned by the same trader**.

Example:

Allowed allocations may include:

- 4 accounts of \$100,000
- 2 accounts of \$200,000

If this limit is exceeded, the company may:

- merge accounts
- restrict additional accounts
- temporarily suspend accounts

This rule ensures balanced risk exposure across the program.

3. Trading Conditions

The Live Stage allows traders to operate with significant flexibility.

Markets Available

Traders may operate in the following markets:

- Forex
- Indices
- Metals
- Energies
- Cryptocurrencies

Leverage and trading costs (spreads and commissions) are those displayed directly on the trading platform.

Allowed Trading Styles

Traders may use their own strategies and preferred trading style.

The following approaches are permitted:

- Manual trading
- Personal trading strategies
- Use of Expert Advisors (EAs)
- Scalping
- Intraday trading
- Swing trading

The program does not restrict trading style, provided that risk management rules are respected.

4. Restricted Trading Practices

To maintain a fair and sustainable trading environment, certain practices are not permitted.

These include:

- arbitrage strategies exploiting pricing errors
- latency arbitrage
- high-frequency trading (HFT)
- tick scalping designed to exploit execution delays
- server spamming or excessive order activity

Accounts must represent **independent trading activity**.

Any trading strategy designed to exploit platform errors, pricing anomalies, execution delays or technical infrastructure limitations may result in account review or suspension.

Multi-Account Strategy Restrictions

Traders may not coordinate strategies across multiple accounts to bypass risk rules.

Examples of prohibited behavior include:

- opening opposite positions between accounts
- mirrored trading designed to hedge risk across accounts
- strategies designed to guarantee profit across multiple accounts

Example:

Opening **BUY on EURUSD in one account and SELL on EURUSD in another account** to guarantee profit regardless of market direction.

Accounts engaging in such practices may be **suspended or permanently closed**.

Third-Party Trading

Accounts must be operated exclusively by the **registered trader**.

The following activities are not permitted:

- account sharing
- external copy trading services
- third-party account management
- selling or transferring account access

What are external copy trading services?

External copy trading services are systems that automatically replicate trades from another trader or signal provider.

Examples include:

- signal provider services
- mirror trading platforms
- automated trade copying systems

Expert Advisors are allowed **only when used as part of the trader's own strategy**.

5. News and Weekend Trading

News Trading

To ensure fair trading conditions and protect traders from extreme market volatility, trading around major high-impact economic news events is restricted.

Traders are not permitted to open new positions within a 10-minute window surrounding the release of major high-impact news, which includes:

- 5 minutes before the scheduled news release
- 5 minutes after the scheduled news release

During this period, opening new trades is not allowed. However, positions opened before the restricted window may remain open and can be managed normally.

Example

If a major economic event, such as U.S. Non-Farm Payrolls or an FOMC Interest Rate Decision, is scheduled at 8:30 PM:

- New trades should not be opened between 8:25 PM and 8:35 PM
 - Traders may open positions before 8:25 PM or after 8:35 PM
-

Weekend Holding

Holding positions over the weekend is permitted.

However, traders should be aware that **market gaps may occur when markets reopen**, which may impact open positions.

Risk management remains the responsibility of the trader.

6. Profit Withdrawals (Payouts)

The Live Stage allows traders to request payouts according to a structured schedule.

First Withdrawal

The first payout may be requested **14 days after the Live account is activated**.

This means the first withdrawal becomes available on **day 15**.

Regular Withdrawal Schedule

After the first payout, withdrawals may be requested **once per week**.

Withdrawal requests are processed every **Tuesday**.

Profit Split

Standard profit split:

- **80% trader / 20% company**

Performance rewards:

- **90% after 3 successful payouts**
- **up to 100% after 3 consecutive profitable months**, subject to internal review

Minimum payout request: **\$100**

Payments are processed within **24 hours**.

Trade Validation

To request a payout:

- only **closed trades** are considered
 - **no open trades** may remain when submitting the request
 - official trading platform records are used for validation
-

7. Account Verification & Review

Before granting Live access or processing payouts, the company may perform a compliance review to verify:

- risk rules were respected
 - no restricted strategies were used
 - trading behavior reflects independent trader activity
-

Identity Verification (KYC)

Identity verification may be required before accessing the Live Stage or requesting payouts.

This may include:

- government-issued identification
 - basic account verification
-

8. Account Security

Each account must be operated exclusively by the registered trader.

For security and compliance purposes:

- Account credentials must not be shared
- Accounts may not be traded by third parties
- Selling or transferring account access is not permitted

These measures ensure that every account reflects the trading activity of the registered user.

9. Account Activity

To maintain an active account, at least **one trade must be opened every 30 days**.

Accounts with no trading activity during this period may be automatically suspended.

10. Trading Location

Traders may access and trade their accounts from different locations, devices, or networks.

This includes trading while traveling, using different internet connections, or switching between devices.

If the system detects unusual or inconsistent access patterns, additional verification may be required.

These checks are standard security procedures designed to protect the account and ensure it is operated by the registered trader.

Final Note

The Live Stage is designed to provide traders with a **professional trading environment** where disciplined traders can operate and receive payouts.

Traders who follow the rules and manage risk responsibly will be able to **trade freely and request payouts without restrictions**.

Platform Authority

All rule validations and trading results are determined using official trading platform and server records.

In case of any discrepancy, the company's server data will be considered the final reference.
