

STEP 2 — Evaluation Rules (2-Step Model)

A Structured Evaluation Designed for Consistency

The Step 2 evaluation is designed to assess a trader's ability to generate profits consistently while maintaining responsible risk management.

The evaluation consists of **two phases**, both operating under the same risk management rules.

Key features of the evaluation:

- No time limit
- Trade your own strategy
- Scalping allowed
- Expert Advisors (EAs) allowed
- News trading allowed
- Positions may be held overnight
- Positions may be held over the weekend

The objective is simple:

Demonstrate consistent trading performance while respecting responsible risk management.

1. Profit Target — Phase 1

To successfully complete **Phase 1**, the account must reach an **8% profit** based on the initial account balance.

Example

Account size: **\$100,000**

Required profit target: **\$8,000**

Once the account balance reaches **\$108,000**, the objective is achieved.

Profit Target Confirmation

The profit target is confirmed **only when the required balance is reached and all trades are closed.**

This ensures that profits are fully realized on the account balance.

All results are verified using **official trading platform and server records.**

2. Min Trading Days Phase 1 & 2

To complete Phase 1, trading activity must occur on **at least three trading days.**

A trading day is counted whenever **at least one trade is opened.**

It does not matter:

- How many trades are taken during the day
- How long the trade remains open
- Whether the trade is profitable or not

As long as one position is opened, that day is considered a valid trading day.

Trading days are calculated based on **server time.**

Each new trading day begins when the trading server resets at: **21:00 UTC (server rollover / New York close)**

For reference, this corresponds approximately to:

- 22:00 CET (Central European Time)
- 01:00 GST (Gulf Standard Time – UAE)
- 02:30 IST (India Standard Time)

Any trade opened within the same trading day will count toward the minimum trading day requirement.

3. Risk Management

To maintain a stable and responsible trading environment, two risk limits apply:

- **Max Daily Loss**
- **Max Loss**

Throughout Phase 1, trading activity must remain within the defined risk limits.

The same risk limits from Phase 1 remain active during Phase 2.

If any risk rule is violated, the evaluation is considered **unsuccessful**.

1.1 Profit Target — Phase 2

Phase 2 confirms the trader's ability to reproduce consistent performance.

To successfully complete **Phase 2**, the account must reach a **5% profit** based on the initial account balance.

Example

Account size: **\$100,000**

Required profit target: **\$5,000**

Once the account balance reaches **\$105,000**, the objective is achieved.

Profit Target Confirmation

The profit target is confirmed **only when the required balance is reached and all trades are closed**.

This ensures that profits are fully realized on the account balance.

Once confirmed, the account progresses to the **Live Stage**.

All results are verified using **official trading platform and server records**.

Max Daily Loss Limit

The account has a **Max Daily Loss Limit of 5%**.

At the start of each trading day, the system records the **higher value between account balance or account equity**.

The allowed Max Daily Loss equals **5% of that value**.

All calculations are based on **equity**, meaning floating profit or loss is included.

Example

Starting balance: **\$100,000**

Max Daily Loss Limit: **\$5,000**

The account equity cannot fall below **\$95,000 during that trading day**.

If this level is reached, the account will be **automatically closed**.

Daily Reset

The daily loss limit resets when the trading server resets:

- **21:00 UTC**

At that moment a new daily limit is calculated.

Max Loss Limit (Fixed)

The account has a **Max Loss Limit of 10%**.

This limit is calculated from the **initial account balance**.

Example

Initial balance: **\$100,000**

Max loss allowed: **\$10,000**

The account equity cannot fall below **\$90,000**.

If this happens, the account will be **automatically closed**.

4. Trading Flexibility

The evaluation allows traders to operate using their own trading methods and preferred strategies.

The following trading approaches are permitted:

- Manual trading
- Personal trading strategies
- Scalping
- Intraday trading
- Swing trading
- Trading during economic news
- Holding positions overnight
- Holding positions over the weekend
- Use of automated trading systems or Expert Advisors (EAs)

The evaluation environment is intended to reflect real **market trading conditions**, giving traders full flexibility in how they approach the market.

Available Markets

Traders may operate in the following markets:

- Forex
- Indices
- Metals
- Energies
- Cryptocurrencies

Maximum leverage: **1:100**

Trading costs (spreads and commissions) are those displayed directly on the trading platform.

5. Fair Trading Environment

The evaluation is designed to reward genuine **trading skill** and **responsible risk management**.

Strategies that rely primarily on exploiting technical inefficiencies rather than market analysis are not compatible with the program.

Examples include:

- Arbitrage strategies exploiting pricing delays
- Latency-based trading systems
- High-frequency trading systems generating extremely large numbers of orders in very short timeframes
- Systems designed to overload the trading server with excessive order activity

These guidelines help maintain a stable and **fair trading environment for all traders**.

Any trading strategy designed to exploit platform errors, technical delays, or infrastructure limitations may result in account review or suspension.

6. Account Security

Each account must be operated exclusively by the registered trader.

For security and compliance purposes:

- Account credentials must not be shared
- Accounts may not be traded by third parties
- Selling or transferring account access is not permitted

These measures ensure that every account reflects the trading activity of the registered user.

7. Automated Trading (Expert Advisors)

The use of Expert Advisors (EAs) and automated trading systems is allowed.

Automation may be used for:

- Strategy execution
- Risk management
- Trade and position management

Automated systems must operate in a way that reflects **normal market trading behavior**.

Systems specifically designed to exploit price-feed delays, latency differences, or other technical inefficiencies are not compatible with the program.

8. Account Activity

To maintain an active account, at least **one trade must be opened every 30 days**.

Accounts with no trading activity during this period may be automatically suspended.

9. Trading Location

Traders may access and trade their accounts from different locations, devices, or networks.

This includes trading while traveling, using different internet connections, or switching between devices.

If the system detects unusual or inconsistent access patterns (for example rapid location changes or activity suggesting shared access), additional verification may be required.

These checks are standard security procedures designed to protect the account and confirm it is operated by the registered trader.

Final Note

Platform Authority

All rule validations and trading results are determined using official trading platform and server records.

In case of any discrepancy, the company's server data will be considered the final reference.

The objective of the Step 2 evaluation is simple: demonstrate consistent trading performance while managing risk responsibly across two phases.

Traders are free to operate using their own strategies and trading style, as long as the risk limits described above are respected.

Once the objectives of Phase 1 and Phase 2 are completed and all rules are met, the account will progress to the Live stage.

All trading activity and results are validated using the official trading platform and server records.
